Wipe Files and Folders

Secure Delete is a powerful tool that permanently wipes out unneeded files and folders from your system. It uses the technique of secure deletion which removes data so thoroughly that even the most powerful recovery tool will not be able to restore it. It prevents your most sensitive information from becoming accessible.

Secure delete should be used with great caution since once data is deleted it will never be able to be recovered.

Click on 'Select Items' to choose the files and folders to be permanently removed from your system.
